

STACK CHEATSHEET

When to use each of the 19 cloned repos — and how to talk to me

This is your personal cheat sheet for the open-source stack cloned at **C:\Users\hamad\Downloads\github open source**. Rule #1: don't name a specific repo when you talk to me. Describe the **NEED** and I'll pick the right tool automatically. Rule #2: this table is in my memory — I auto-load it every session.

1. SaaS Base Layer

Start here for any new application project.

Repo	When to use	When NOT to use	Path	What to say to me
SaaS-Boilerplate (ixartz)	New multi-tenant SaaS. Drizzle, Stripe, Storybook, i18n already wired.	Simple one-page app, internal tool	01-saas-base/SaaS-Boilerplate	"Build me a SaaS for X"
saas-starter (nextjs)	Quick Next.js + Stripe + Postgres. Simpler than Boilerplate.	Need i18n or multi-tenancy	01-saas-base/saas-starter	"Quick Next.js app with Stripe"
shadcn/ui	Any React/Tailwind UI. Default for all UI work.	Non-React stack (Vue, Svelte)	01-saas-base/ui	(auto — I just use it)
Radix UI	Accessible primitives: dialogs, dropdowns, tabs. Pairs with shadcn.	Already have a UI lib	01-saas-base/primitives	"Need accessible dialog"
Tailgrids	Pre-built marketing blocks (hero, pricing, footer). Fallback only.	shadcn has the block	01-saas-base/tailgrids	"I need a marketing landing page fast"
Fumadocs	Docs site for a project.	Project doesn't need docs	01-saas-base/fumadocs	"Add docs site"

Rule: New app → SaaS-Boilerplate or saas-starter. New UI → shadcn. Anything else → ask me.

2. Ops Layer — Production Infrastructure

Repo	When to use	When NOT to use	Path	What to say to me
PostHog	Product analytics, funnels, feature flags, session replay, A/B tests. Use for ALL analytics.	You only need server logs	02-ops/posthog	"Track conversion funnel" / "Add analytics"
Langfuse	Tracing LLM calls, prompt versions, evaluating AI outputs. Use for ANY project with LLM.	Project has no AI	02-ops/langfuse	"Add observability for the agent"
OpenObserve	Logs/metrics/traces. Drop-in Datadog/Splunk replacement. Rust-based, Docker only.	Just use hosted Langfuse or PostHog	02-ops/openobserve	"Need a Datadog alternative"
Playwright	E2E browser tests, booking flows, chat widgets, form submissions. Default for E2E in any web project.	Pure API-only (no UI)	02-ops/playwright	"Add E2E tests for the booking flow"

Rule: New project with LLM → Langfuse. Web project → Playwright E2E. Analytics → PostHog.

3. Agents Layer — AI Agent Frameworks

■ Important: pick ONE framework. Don't mix.

Repo	When to use	When NOT to use	Path	What to say to me
Mastra ★ (DEFAULT)	ALL TS agent projects. Modern, TS-first, memory, RAG, MCP, voice, workflows.	You're locked into a different stack	03-agents/mastra	"Build me an AI agent for X"
VoltAgent	Only if you want voice/RAG-heavy platform with VoltAgent-specific patterns.	Most cases	03-agents/voltagent	"Use VoltAgent instead of Mastra"

Repo	When to use	When NOT to use	Path	What to say to me
OpenAI Agents JS	Only if you must use OpenAI SDK directly.	Most cases	03-agents/openai-agents-js	(rarely)
Microsoft Agent FW	.NET or Python projects.	TS or JS projects	03-agents/microsoft-agent-framework	".NET agent for X"
Google ADK	Python projects that need Google's agent eval tooling.	TS or JS	03-agents/google-adk-python	"Python agent for X"
Mem0	Long-term memory for agents. Remembering returning customers, conversation history across sessions.	Single-session, stateless	03-agents/mem0	"Agent should remember returning customers"

Rule: TS project → Mastra. Python → Google ADK. Need memory across sessions → Mem0 (adds to any framework).

4. Payments

Repo	When to use	When NOT to use	Path	What to say to me
Polar	Building a SaaS that needs subscriptions / payments.	You're a service business, or you don't take money online	04-payments/polar	"Add subscriptions to my SaaS"

Don't use Polar for your car wash. You take InstaPay / Vodafone Cash / Fawry, not card subs.

Quick Decision Flow

Building a new project?

- SaaS / multi-tenant → SaaS-Boilerplate
- Simple Next.js app → saas-starter
- Other → ask me

Adding UI?

- shadcn/ui (auto — I just use it)

Adding LLM features?

- Need agent that does things → Mastra
- Need to TRACE the LLM → Langfuse
- Need to REMEMBER across sessions → Mem0

Adding observability?

- User behavior → PostHog
- LLM behavior → Langfuse
- Server logs → OpenObserve (Docker, last resort)
- Browser tests → Playwright

Adding docs?

- Fumadocs

Need payments?

- Polar (only if SaaS, not for service business)

What to say in chat — Good vs Bad examples

■ Good (let me pick the right tool)

- "Build me a SaaS for booking yoga classes"
- "Add analytics to the landing page"

- "Customers complain the chatbot forgets them"
- "Make a docs site for the API"
- "Test the booking flow end-to-end"

■ Bad (don't name a specific repo)

- "Use SaaS-Boilerplate"
- "Use Langfuse for the agent"
- "Use Mastra"

Exception: if you specifically want a different tool than I'd default to, name it. E.g. "Use VoltAgent instead of Mastra" — that's a real override.

Will this work with any AI?

Yes — the table is about tools, not models. Any AI (me, Codex, Hermes, Claude, GPT) that has access to the repos can use them. The agent memory I wrote auto-loads this table into my context every session, so I never forget. If you switch to a different AI, you'll need to give it the same stack catalog (or just paste this document into its context).
